TABULATING EQUIPMENT CARD PROCESSING OPERATIONS

Standard Time Values for Determining Operational Effectiveness for Planning Estimates and for Budget Preparation

U. S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS Management and Organization Division

•

•

PREFACE

This is a booklet of standard time values for card processing operations on tabulating equipment. It is one of a series of manuals on clerical standard data and machine standards prepared by the Management and Organization Division of the Bureau of the Census.

The tabulating equipment standards in this publication were developed and installed in the Census Bureau early in 1962. They have been used for measuring individual and group performances, determining eligibility for incentive awards, and estimating and budgeting work activities. While they reflect the work layout and procedures of the Census Bureau, it is felt that these standards are substantially applicable to card processing operations on identical machines located elsewhere in the Federal service. The method of operating the machines is fairly uniform, and the standards are sufficiently detailed to measure almost any arrangement of cards and jobs. Their use should result in greater operational efficiency in a card processing installation. These standards replaced "Percent Normal Working Time" standards which had been in effect for about four years, and measured only the physical activities of the operator during machine operations.

It is hoped that this publication proves to be informative and useful to the readers and that it contributes to the advancement of scientific management in the Federal service.

Part I

Estimating Large Volume Tabulating Machine Operations

INTRODUCTION

Immediately following this text is a table of standard time values, on a per card cycle basis, for various types of tabulating equipment. Most of the machines are used wherever automatic card processing is being performed. A card cycle represents the passing of a punch card from the card hopper of a machine, through the feed mechanism, into the eject pocket. The standards are in decimal minutes. They should be used for estimating large card processing operations for which detailed specifications for each machine job are not available. (Estimates for specific jobs should be determined from detailed standard time values or related charts shown elsewhere in this booklet.)

It is quite simple to use these standards. Once the estimated volume of card cycles is known for each machine, either multiply the volume by the standard minutes per card cycle and then convert to manhours or man-days, or divide estimated volume of card cycles by the standard production per hour or per day shown on the adjoining table.

On most machines, total card cycles processed is the same as total cards in the job. When using the sorters, however, cards may pass through the machine more than once, depending on the number of columns on which the cards have to be sorted, so that the card cycle count may exceed the actual number of cards in the job by one or more times. For example, if a large operation calls for a 1-column sort of 500,000 cards, there will be an equal number of card cycles. If it calls for a 2-column sort, there will be 1,000,000 card cycles because each card has to pass through the sorter twice. If the operation calls for a 10-column sort, the card cycle total will be 5,000,000 (10 X 500,000).

When determining card cycle volumes for the collators, count only those cards which will pass through the major or primary feed. Do not include the cards for the minor or secondary feed. Standard time values are based on the card cycle count from the major or primary feed.

The card cycle count for the hookup of the accounting machine and reproducer should include only the total cards which will be processed on the accounting machine. Do not include the cards which will pass through the reproducer for summary punching.

The standard time values provide for the complete machine job; i.e., getting the machine assignment from the supervisor, moving the cards to the appropriate machine and arranging them for processing, changing boards as necessary, getting and inserting tabulating paper as necessary, running tests when required (card cycles of tests are counted for standards purposes with the card cycles in the job), performing the actual card processing on the machine, making necessary recordkeeping entries, assembling and labeling the finished work, and securing the machine when the job is finished.

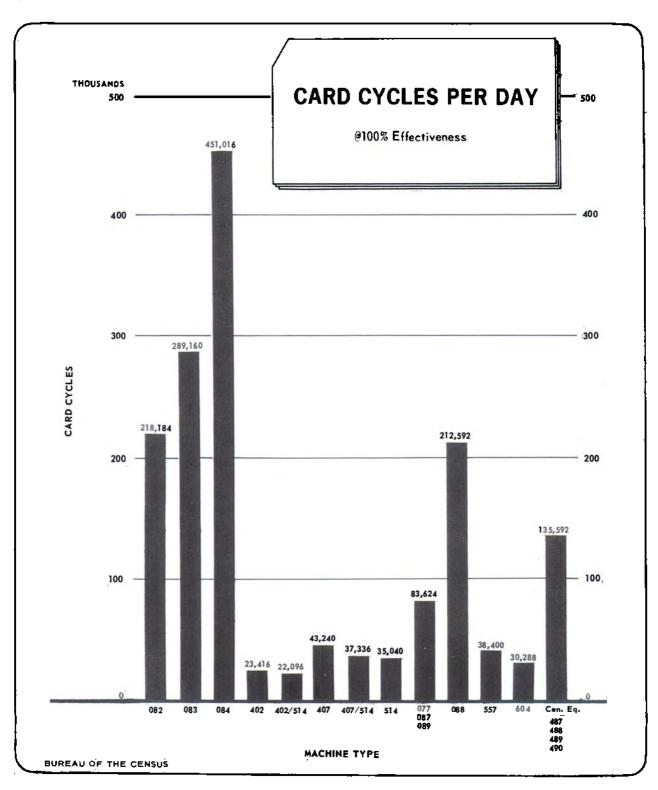

The bar chart following the table graphically presents card cycle volume per day at 100% effectiveness for the different types of tabulating equipment.

TABULATING EQUIPMENT

TIME VALUES & OUTPUT

Machine Type	Standard Minutes Per Card Cycle	Card Cycles Per Hour @ 100%	Card Cycles Per Day @ 100%

IBM 557 Interpreter	.01250	4800	38400
IBM 604 Calculator	.01590	3786	30288
Census Equipment 487, 488, 489, 490 (Select, Check, etc.)	.00354	16949	135592

- *For the sorters, card cycle volume usually is determined by multiplying total cards in the job by the number of times they will pass (columns sorted) through the machine; e.g., 10000 cards sorted on 5 columns equals 50000 card cycles.
- ** The time values for the hookups are based on the number of cards processed on the Accounting Machines only. Do not include summary cards.
- *** The time values for Collators are based on the number of cards passed through the machine from the primary feed only.

ORIGIN

A brief explanation of the development of these standards is presented below.

Detailed engineered production standards, developed in the Census Bureau in 1962, were available for each type of tabulating equipment. These standards were used for measuring individual performances of tabulating equipment operators. The operators recorded specific details of each job on a "Daily Time and Production Record" form. Monthly operator performances were computed from the data reported. Data was compiled for a selected three-month period (July, August, September, 1961) to develop the card cycle time values for each machine type. Production records for this period provided a large number and an extensive variety of machine jobs for the study.

Pertinent details of every machine job on the production records were summarized on "tally" forms for each type of machine. A copy of one of the "tally" forms with actual jobs posted on it is shown on page 9. This sample form was selected from the 083 Sorter group in the "work unit" range of 2801-4000 cards. The form was designed to list the jobs separately by ranges of "work unit" size shown in the detailed standards to simplify the final computations.

Total minutes produced and total card cycles processed were determined for each type of machine, using the detailed engineered standards for computing minutes produced. These figures were computed for each page of jobs and then the page totals were summarized by machine type. An example of the computations performed for each page is shown on page 10. The computations in the example summarize the data for the 083 Sorter jobs listed on the "tally" form.

When all computations were completed there were two totals for each machine type - standard minutes produced and card cycles processed. Standard minutes produced was divided by card cycles processed for each machine type to determine the standard time value per card cycle.

An interesting bit of information is that during the sample period of three months, a total of 155,060,075 card cycles was processed during 6,840 machine jobs. In addition, 2,152 of the jobs were performed on the 083 Sorters, and they required 126,706,292 card cycles for processing.

GROUP MEASUREMENT

In the Census Bureau group performance of tabulating units are measured with the machine card cycle standards. The operators record the machine type code number, total card cycles processed, start and stop time, and other identifying information for each machine job. The automatic data processing equipment computes, summarizes and tabulates the information.

The table on the following page furnishes performance results for nine months using the group standards which were officially applied in January, 1965. The results are very favorable as shown by the steady improvement in performance and the high level attained.

If any organization has a large tabulating activity with a consistent, heavy workload of diversified machine jobs, it seems reasonable to assume that these standards would work out fairly well for measuring group productivity.

TABULATING EQUIPMENT OPERATIONS GROUP PERFORMANCE Part II

Charting Standard Time Values for Specific Jobs on Tabulating Equipment

.

~

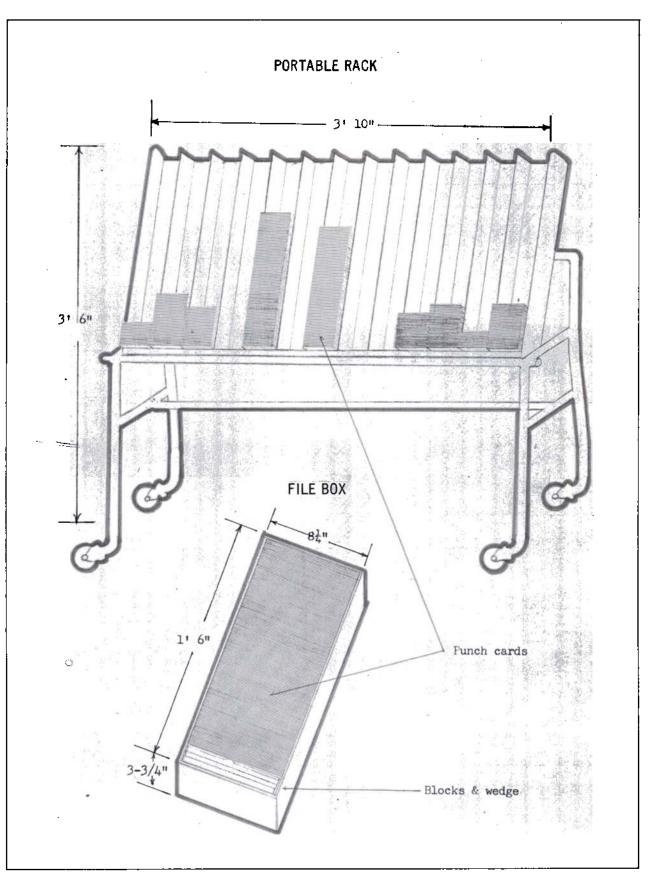

INTRODUCTION TO CHARTS

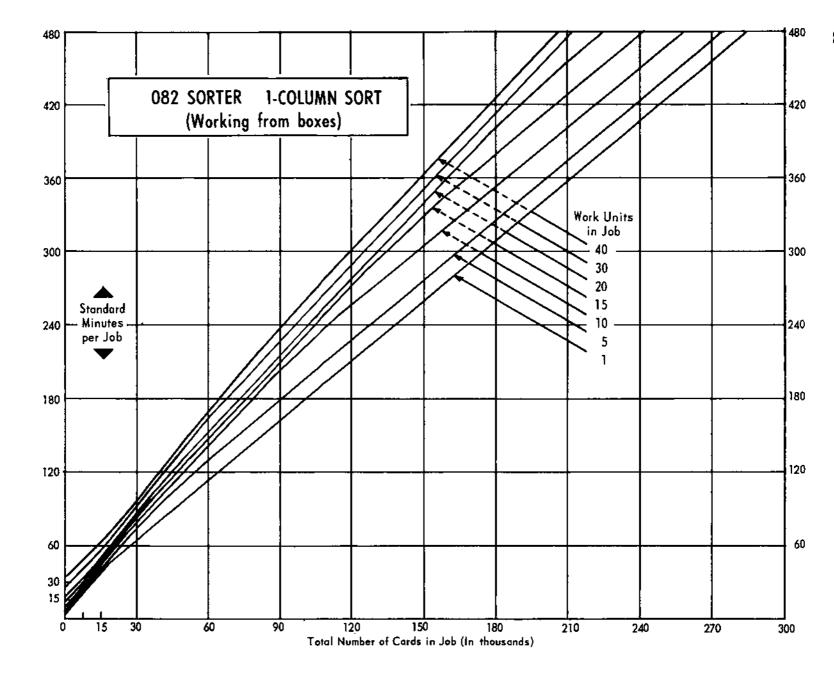

The charts on the following pages provide a quick and easy method for determining total standard minutes required to perform card processing jobs on tabulating equipment. To use the charts, it is necessary to know the type of job to be performed and the total number of cards in the job. Select the appropriate chart, find the point on the abscissa (base line) for the total number of cards in the job, trace a line vertically up to the intersecting point of the appropriate "Work Unit" line on the chart, trace a line horizontally from there to the ordinate scale, then read the standard minutes required for the job at the point of intersection.

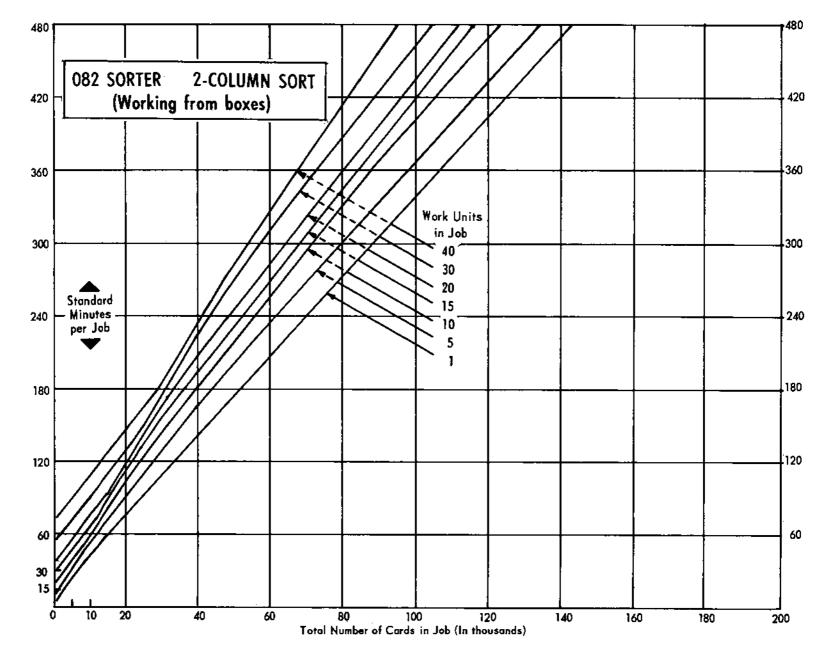

The charts contain separate lines for selecting time values according to the number of work units in a job. In many machine jobs the card deck is divided into groups which represent distinct categories such as county, region, state, commodity, etc. Each group is a work unit if it is machine processed separately. All cards in a work unit must be processed together, removed from the machine pockets before starting the next group, and boxed and identified by their category. The processing of each work unit requires machine stoppage, additional card handling, and other operator activity external to the machine time so that the total time span for a job is increased somewhat in relation to the number of work units in the job. A job must be considered as one work unit if the entire card deck is to be machine processed in one continuous run, irrespective of how the cards are arranged.

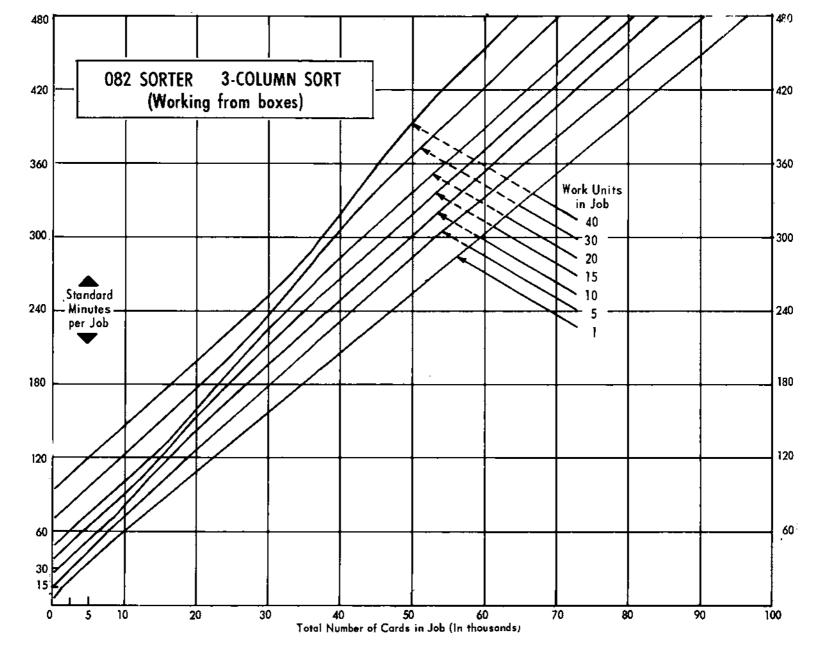

The lines plotted on the charts were constructed from detailed, engineered standards which are shown in this booklet. The time values provide for all work necessary to complete the machine assignments. This includes receiving instructions, getting the work and arranging it at the appropriate machine, preparing the machine for operation, running the job, performing recordkeeping, and securing the cards and machine when finished. Variables such as tests and problem cards (jams, out-ofsequence, etc.) have been included in the time values according to their frequency of occurrence based on work experience in the Bureau of the Census. If a more precise time value is desired on a job for which all actual units of measure (set up, problem card occurrence, problem cards, tests, work units, card cycles) are known, it is suggested that the detailed, engineered standards be used.

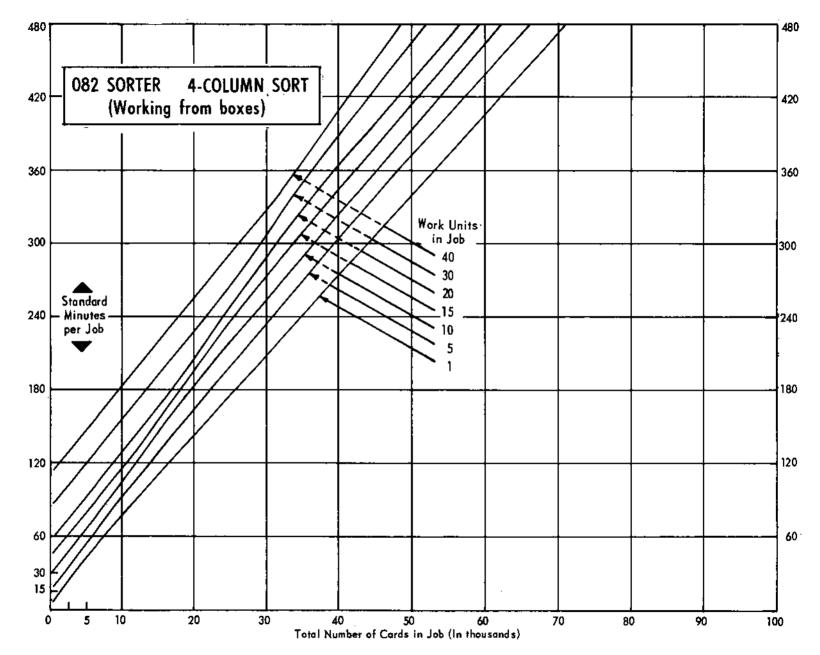

Charts for several of the faster machines, such as sorters and collators, specify "Working from boxes" in the titles. This indicates that the card deck is filed in boxes rather than racks. The machines with this distinction have two series of detailed "Work Unit" standards, one for boxes and the other for racks. Some of the jobs take a little less time when the cards are filed in racks. Charts were not developed for jobs using racks because of the infrequent occurrence of these jobs in the Census Bureau. Generally, it is more convenient to identify, handle, and store card files when they are in boxes. No distinction between working from boxes and working from racks is made for the slower machines. Sketches of a card rack and file box are shown on the following page.

Part III

Detailed Engineered Standards for Tabulating Equipment

-

INTRODUCTION TO DETAILED STANDARDS

I

This part of the manual includes detailed engineered standards, used primarily to measure individual operator performance. The standards are appropriate for computing operator performance on each machine job or for determining individual and group performance on a daily, weekly, monthly, and quarterly basis. Performances can also be computed by machine type if more precise budgeting figures are desired.

A power machine operation involves two major functions - the cycling action of the machine, and the necessary physical activities of the operator. The standards provide for the entire running time of a machine and only that part of the operator's activities which must be performed while the machine is idle, such as positioning the sensing brush for the next column sort or emptying the machine stackers at the end of a column sort before starting the next sort.

The manual activities which can be done only when the machine is stopped are identified as "external" elements; the remaining necessary manual activities which are performed while the machine is running (cycling) are called "internal" elements. Careful analysis must be made of a machine operation to determine the amount of physical activity which is required, and to distinguish accurately between "external" and "internal" elements. Most of the elements are performed over and over during the course of a machine operation. The decision as to whether they are external or internal elements, and how many times

they occur in either case, depends usually upon the time of their occurrence in the operation.

The "Work Unit" standard provides for the external physical elements of the operator while handling the cards and operating the machine. A machine job contains more than one work unit when the card deck is separated into groups representing intermediate classifications, and these groups are processed independently of each other during the course of the job.

An example of the development of a "Work Unit" standard is shown immediately following the standards tables. It relates to the operation "Ordinary Gang Punching" on the 514 Reproducing Punch.

A writeup of general operating procedures precedes the standards for each type of machine operation. A few of the physical elements involved in operating tabulating equipment are: position file box from truck top to truck shelf, insert file box wedges, empty machine pocket to box or rack, load machine hopper from box or rack, start machine, empty all pockets to machine top, sight check, cards from machine top to file box or rack, reset counter, etc.

The normal times for manual elements in the standards have been increased by an allowance of 10% to provide for personal time and unavoidable delays. The actual times for machine cycling (card cycles) have been increased by 5% to provide only for personal time.

The units of measure which comprise the series of detailed standards for tabulating equipment are: SET UP, FIRST TEST, ADDITIONAL TEST, PROBLEM CARDS, WORK UNIT, JOB, and CARD CYCLE. A brief but informative explanation of each is provided below.

SET UP

An operator receives the appropriate set up time value for each assignment of work performed on a specific machine. Generally, this standard provides for the time spent by the operator in receiving instructions, getting the work and placing it in a convenient location by the machine, preparing the machine for the job (switches, control panel, tab paper, etc.), securing the work and machine when finished, and recordkeeping. Usually each machine job represents an assignment and requires a set up. Occasionally several different jobs may be performed on the same machine with the same deck of cards. When this occurs, only one set up is allowed.

TESTS

A test deck of cards is run through a machine to be sure that it is operating correctly. Test runs are made only on certain types of machines. These are identified by the test standards listed in the tables of standards. When an operator performs one or more tests as directed, he is entitled to the appropriate test standard (first/additional) for the number of tests made. This standard provides for getting the test material, running the test, checking and recording the results, and returning the test material. The card cycles of the test(s) are counted with the card cycles of the job when recording production counts for standard computation purposes.

PROBLEM CARDS

Problem cards occur while the machine is in operation for reasons such as jamming of card(s) and out-of-sequence card(s). The standard provides for removing the problem card(s) from the machine, correcting it as necessary, replacing it, and starting the machine. Two standards are involved, one for occurrence of problem cards and the other for cards corrected. When problem cards occur in a job, the operator must record the counts on his daily production form.

WORK UNIT

The work unit standard consists of the necessary "external" physical activities which an operator performs on a machine job. The external elements occur immediately before and after the processing of a work unit, between column sorts on the sorters, and occasionally when a high-speed 084 Sorter overtakes the operator on a large-volume job. In most machine jobs the card deck is composed of either one work unit in its entirety or of two or more work units (groups of cards) which represent different categories or sub-groupings in the card deck. These groups may be counties, regions, states, crops, commodities, or any other classification. The groups are counted as separate work units only if they are processed independently of each other in running the job. All cards in a work unit must be passed through the machine and removed from the machine pockets before the next group is started, counted and recorded as a separate total, boxed separately, and identified by their category.

The machine operator records the number of work units in each job processed. The applicable work unit standard for a job is multiplied

by the total number of work units to determine minutes produced for this part of the job.

Occasionally a card deck for a machine job is passed through the machine in one continuous process although it may consist of a series of items or types, or it may contain lead cards which precede and identify different sections. When this occurs, the card deck is counted as <u>one</u> work unit for standards purposes.

Some terms are used in relation to the work unit standards which require clarification. These terms are:

<u>Number of Columns Sorted</u>—In processing a work unit of a sorter job, the external physical activities of an operator increase with each additional column in which the cards are sorted. For this reason, the work unit standards for sorters were constructed to provide standard times per work unit according to the number of columns sorted in a job.

<u>Average Size of Work Unit (cards)</u>—There is no uniformity in the size of work units in a job. They can be very large or very small, and completely different within a job - from handfuls of cards to boxes full. In processing work units in a job, the amount of external physical activity performed by an operator depends on the number of cards in the work unit. The work increases as the volume of cards increases. Therefore, the work unit standards were constructed to furnish a range of time values by size of work unit. Since most of the work unit elements relate to card and box handling it was necessary to use a uniform volume of cards in a handful and box full to maintain consistency in applying the frequency of occurrence of elements in the standard writeups. In these standards, a handful of cards is 400 and a box full, 2000. These quantities were established through extensive studies of tabulating equipment operations performed at the Census Bureau. The range of work unit sizes in the standard tables conforms to these quantities (1-400, 401-800, 801-1200, 1201-2000, etc.).

Proper use of these standards requires that machine operators record on a daily production form the total cards, as well as the number of work units in a machine job. If a job of 11000 cards has only one work unit, the work unit size is 11000. The standard to use from the tables is the one in the work unit range of "10401 or more" for the 082 and 083 sorters or "1201 or more" for most of the other machines. If a job has 10560 cards and it contains 12 work units, one must first determine the average size of the work units. This is done by dividing total cards by number of work units. In this case the average work unit size is 880, and the standard time value to use is found in the range of "801-1200" on the work unit standard tables. When the time value is selected it is multiplied by the number of work units in the job to determine standard minutes produced.

Working from Boxes or Racks—The sorter and collator work unit standards distinguish between working from boxes and working from racks. With the high-speed machines it takes less external physical activity to work from portable racks than from boxes. This advantage is offset, however, by the fact that boxes are more suitable for handling, identifying, and storing cards. For this reason, boxes are used for most machine jobs at the Census Bureau. The work unit standards for slower machines were constructed with box handling elements only

because most of the jobs are assembled in boxes. The difference in time as compared with racks is insignificant. In the few instances when racks are used for the slower machines the same work unit standards are applied.

<u>JOB</u>

The "Job" standards relate only to the 557 Interpreter and the operation Interspersed Gang Punching on the 514 Reproducer. The necessary external physical activities of the operator occur only at the start and end of a job for these machine operations. Since all other manual elements required to process the cards are internal to the machine cycling, work unit standards are not required. Breaker or separator cards are inserted by the operator to separate work units when the last handful of cards for a work unit is placed in the hopper. The standard time value per job is credited to an operator each time he completes a job of the type mentioned above.

CARD CYCLE

This standard time value provides for the machine cycling time during an operation. Standard minutes produced is determined by multiplying total number of cards passed through a machine by the appropriate card cycle standard.

In a numerical sorting operation the cards pass through the machine as many times as the number of columns sorted. The total number of card cycles (passes) may far exceed the actual number of cards in a job. For standard computation purposes, the machine operator must record the number of columns sorted as well as the total number of cards in a job. The multiplication of the two results in the actual number of card cycles for computing production performance. A count of card passes for a job may also be obtained by using a counter attachment to accumulate the total, although this involves some arithmetic computations by the operator when <u>actual</u> card counts are required for each work unit and for the total job.

An alphabetic sort involves more card passes to a column with the same number of cards than does a numerical sort. When sorting alphabetically on the 083 for example, all cards are passed through the machine the first time for a column sort, with the sort selection switch set at A-1. This sorts cards with a zone 12 punch by letters A to I and stacks cards with a zone 11 or 0 punch in the identical machine pockets. The A to I cards are removed and filed in order. The sort selection switch is then set to A-2 and the cards which fell in zone 11 and 0 pockets are passed separately through the machine to sort them by J to R and S to Z respectively. These cards are filed in order following the A to I cards. This procedure is repeated for each additional column sorted. Alphabetic, like numerical sorting, starts at a righthand column of a field in a card and progresses to the left. This type of sort requires approximately 1-2/3 passes per card for each column sorted. The counter attachment on a sorter keeps a cumulative count of the card passes made so that a total for the job is available whether by continuous count or by work unit count and totalization.

On the accounting machines and collators the occurrence of card passes through the machine may vary from the actual machine cycles depending on the type of operation being performed. A card may remain

stationary in the accounting machine while it is being read several times as the machine is cycling. On collating operations using both card feeds, as in matching, merging, and matching-merging, the cards may pass through either feed or they may pass simultaneously through both feeds while the machine is cycling. Because of the variable nature of the card passes in these operations, the machines have clock attachments which show the actual running time. Standard minutes produced is determined by adding a percent personal allowance to the running time of a job. Card cycle standards are available also in case a machine does not have a clock attachment. These standards were developed from the running times and appropriate card counts recorded from jobs on machines with clocks. Standard minutes produced is determined by multiplying the standard time value by the actual number of cards processed in a job. For the accounting machines it is the total of cards passed through the machine; for the collators on matching, merging, and matching-merging operations it is the total of cards passed through the primary feed.

PORTABLE TRUCK - "COOKIE PUSHER"

The general operating procedures which follow frequently refer to a "cookle pusher" in the text. This is the rather odd name given by the work force to a type of portable truck. The truck is used to transport and store boxes of punch cards in the work area. A sketch of the truck is shown below.

SORTERS - SORT ONE COLUMN

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup which includes:
 - A. Turn on power switch.
 - B. Arrange the working area.
 - C. Secure work to be processed and the required equipment.
 - D. Set sorting brush at required column.
 - E. Set appropriate switches.
 - F. Reset Veeder counter.
 - G. Record personnel and machine times.
- II. Standards provide for work accomplished in the following sequence:
 - A. At the beginning of a work unit:
 - 1. Box moved from shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) jogged and loaded into hopper.
 - 4. Machine started.
 - 5. Second or more handfuls of cards jogged and loaded into hopper.
 - B. For each 400 card cycles:
 - 1. One handful of cards jogged and loaded into hopper.
 - 2. Cards removed as required from stacker containing the greatest number of cards.
 - 3. Cards jogged, sight-checked, and placed in sorting rack.
 - C. At the end of each work unit:
 - 1. Cards removed from all stackers, jogged, sight-checked, and placed in sorting rack or boxes according to size of work unit.
 - 2. Cards transferred from sorting rack to boxes.
 - 3. Blocks and wedges inserted.
 - 4. Box labels modified and numbered.
 - 5. Boxes moved from the top to the shelf of cookie pusher.
 - 6. Veeder count posted to control sheet.
 - 7. Reset counter.

III. Other provisions:

A. The standards provide for the complete disposition of each work unit before the following work unit is started. Page 2 Sorters - Sort One Column

- B. Box handling:
 - 1. The standards provide for handling and opening one box per 2,000 cards or fraction thereof.
 - 2. The standards provide forhandling, labeling, and closing one box per 2,000 cards or fraction thereof.

SORTERS - SORT TWO OR MORE COLUMNS

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup which includes:
 - A. Turn on power switch.
 - B. Arrange the work area.
 - C. Secure work to be processed and the required equipment.
 - D. Set sorting brush at the first column to be sorted.
 - E. Set appropriate switches.
 - F. Reset the Veeder counter.
 - G. Record personnel and machine times.
- II. Standards provide for work accomplished in the following sequence:
 - A. At the beginning of a work unit:
 - 1. Box moved from shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) jogged and loaded into hopper.
 - 4. Machine started.
 - 5. Second or more handfuls of cards jogged and loaded into hopper.
 - B. At the beginning of each column except the first:
 - 1. Jog, sight-check and load one handful of cards into hopper.
 - 2. Start machine.
 - 3. Jog, sight-check and load second or more handfuls of cards into hopper.
 - C. For each 400 card cycles in first column sorted:
 - 1. One handful of cards jogged and loaded into hopper.
 - 2. Cards removed as required from stacker containing the greatest number of cards.
 - 3. Cards jogged and placed in sorting rack.
 - D. For each 400 card cycles in all columns other than the first and last columns sorted:
 - 1. Jog, sight-check and load one handful of cards into hopper.
 - 2. Cards removed as required from stacker containing the greatest number of cards.
 - 3. Cards jogged and placed in sorting rack.

- E. For each 400 card cycles in the last column sorted:
 - 1. Jog, sight-check and load one handful of cards into hopper.
 - 2. Cards removed as required from stacker containing the greatest number of cards.
 - 3. Cards jogged and sight-checked.
 - 4. Cards placed in sorting rack and transferred to box.
- F. At the end of the first column sorted:
 - 1. Post Veeder count to control sheet.
- G. At the end of each column except the last:
 - 1. Cards removed from all stackers, jogged and placed in sorting rack or on machine top according to size of work unit.
 - 2. Sensing brush moved to next column.
- H. At the end of each work unit:
 - 1. Cards removed from all stackers, jogged, sight-checked and placed in sorting rack or boxes according to size of work unit.
 - 2. Cards transferred from sorting rack to boxes.
 - 3. Blocks and wedges inserted.
 - 4. Box labels modified and numbered.
 - 5. Boxes moved from the top to the shelf of cookie pusher.
 - 6. Reset counter.
- III. Other provisions:
 - A. The standards provide for the complete disposition of each work unit before the following work unit is started.
 - B. The standards provide for starting from boxes and working into a sorting rack or onto the machine top depending upon the work unit size. On the last column sorted the cards are placed in boxes or in a rack and transferred to boxes at the end of the pass.
 - C. The standards provide for handling, opening, closing, and labeling one box per 2,000 cards or fraction thereof.

COLLATORS - SEQUENCE CHECKING (One Feed)

CENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed.
 - B. Arrange the working area.
 - C. Secure and insert one control panel.
 - D. Secure a test deck.
 - E. Test the machine.
 - F. Return the test deck.
 - G. Reset counters.
 - H. Record personnel and machine times.
- II. The standards provide for work accomplished in the following sequence:
 - A. At the beginning of each work unit:
 - 1. Box moved from the shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - For the first work unit only:
 - a. First 15 (approximate) cards loaded into hopper with one card marked and deliberately mis-filed.
 - b. Machine started.
 - c. Cards removed from stackers at error stop.
 - d. Error light reset and cards run out.
 - e. Cards removed from stacker and marked card refiled.
 - f. First 15 cards restored to proper place in box.
 - 4. First handful (400 cards) jogged and loaded into hopper.
 - 5. Machine started.
 - 6. Second handful loaded into hopper.
 - B. At the end of each 400 card cycles:
 - 1. Handful loaded to hopper.
 - 2. Cards removed from stacker.
 - 3. Cards jogged and placed in box.
 - C. At the end of each work unit:
 - 1. Cards run out into stacker.
 - 2. Cards removed from stacker.
 - 3. Cards jogged and placed in box.
 - 4. Blocks and wedge inserted.
 - 5. Box moved from top to shelf of cookie pusher.
 - 6. Veeder counter total posted to control sheet.
 - 7. Reset counter.

Page 2 Collators - Sequence Checking (One Feed)

III. Other provisions:

- A. The standards provide for the complete disposition of each work unit before the following work unit is started.
- B. When work units consist of more than 2,000 cards, the standards provide for the insertion and removal of blocks and wedges for one box per 2,000 cards or fraction thereof.

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed.
 - B. Arrange the working area.
 - C. Secure and insert the control panel.
 - D. Secure a test deck.
 - E. Test the machine.

- F. Return the test deck.
- G. Reset counters and clock.
- H. Record personnel and machine times.
- II. The standards provide for work accomplished in the following sequence:
 - A. At the beginning of each work unit:
 - 1. Box for primary feed moved from the shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) jogged and loaded into primary hopper.
 - 4. Box for secondary feed moved from the shelf to the top of cookie pusher.
 - 5. Wedge and blocks removed.
 - 6. First handful jogged and loaded into secondary hopper.
 - 7. Machine started.
 - 8. Second handful loaded into primary hopper.
 - 9. Second handful loaded into secondary hopper.
 - 10. First new box for each of two select stackers moved to top of cookie pusher.
 - 11. Each new box label marked with required identification.
 - 12. For the first work unit only:
 - a. Cards removed from matched stackers.
 - b. First matched pair compared for accuracy of match.
 - c. All cards placed in boxes.
 - d. First unmatched primary card (when available) checked against both matched and unmatched secondaries to verify accuracy of selection.
 - e. First unmatched secondary card (when available) checked against both matched and unmatched primaries to verify accuracy of selection.
 - B. At the completion of each 400 stacked cards in any of the four stackers:
 - 1. Cards removed from stacker.
 - 2. Cards jogged and placed in box.
 - 3. Hoppers checked and loaded by handfuls of 400 cards as required.

Page 2 Collators - Matching

C. At the end of each work unit:

- 1. Cards run out into stackers.
- 2. Cards removed from stackers. (4)
- 3. Cards jogged and placed in boxes. (4)
- 4. Blocks and wedges inserted. (4 boxes)
- 5. Boxes (4) moved from the top to the shelves of cookie pusher.
- 6. Post Veeder counter total to control sheet.
- 7. Reset counter.

III. Other provisions:

- A. The standards provide for the complete disposition of each work unit before the following work unit is started.
- B. Box handling:
 - 1. The standards provide for handling and opening two boxes per 4,000 total cards or fraction thereof.
 - 2. The standards provide for handling, closing and labeling two boxes per work unit plus two boxes per 4,000 total cards or fraction thereof.

MATCHING

Standard Minutes

- If the machine has a clock attachment, use the recorded running time for a job to compute standard minutes produced. This is performed simply by increasing the running time with a percent personal allowance (5% is used at Census Bureau).
- If the machine does not have a clock attachment, use the card cycle standard time values listed below to compute standard production. Merely multiply the card cycle standard by the <u>actual</u> number of cards processed through the primary feed of the machine. (See explanation on page 79)

Standard Minutes per at Census Bureau):	CARD CYCLE (based on work experience	
,	088 Collator	.00185

COLLATORS - MERGING

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed.
 - B. Arrange the working area.
 - C. Secure and insert the control panel.
 - D. Secure a test deck.
 - E. Test the machine.
 - F. Return the test deck.
 - G. Reset counters and clock.
 - H. Record personnel and machine times.
- II. The standards provide for work accomplished in the following sequence:
 - A. At the beginning of each work unit:
 - 1. Box for primary feed moved from the shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. For the first work unit only:
 - a. Control number of the first card recorded. b. First card marked.
 - 4. Sequence of first six cards checked manually.
 - 5. First handful (400 cards) jogged and loaded into primary hopper.
 - 6. Box for secondary feed moved from the shelf to the top of cookie pusher.
 - 7. Wedge and blocks removed.
 - 8. For the first work unit only:
 - a. Control number of the first card recorded. b. First card marked.
 - 9. Sequence of first six cards checked manually.
 - 10. First handful jogged and loaded into secondary hopper.
 - 11. Machine started.
 - 12. Second handful loaded into primary hopper.
 - 13. Second handful loaded into secondary hopper.

· ----

- 14. First new box for merged cards moved to top of cookie pusher and labeled.
- B. At the completion of each 400 merged cards:
 - 1. Cards removed from stacker.
 - 2. Cards jogged.

Page 2 Collators - Merging

- 3. For the first 400 merged cards only:
 - a. Check made to verify that the first card is the marked card with the lower recorded control number.
 - b. Check made to verify that the marked card with the higher recorded control number has been correctly merged.
- 4. Cards placed in box.
- 5. Hoppers checked and loaded by handfuls of 400 cards as required.
- C. At the end of each work unit:
 - 1. Cards run out into stacker.
 - 2. Cards removed from stacker.
 - 3. Cards jogged and placed in box.
 - 4. Blocks and wedge inserted.
 - 5. Box moved from the top to the shelf of cookie pusher.
 - 6. Post Veeder counter total to control sheet.
 - 7. Reset counter.
- III. Other provisions:
 - A. The standards provide for the complete disposition of each work unit before the following work unit is started.
 - B. Box handling:
 - 1. The standards provide for handling, opening, and voiding labels on two boxes per 4,000 merged cards or fraction thereof.
 - 2. The standards provide for handling, labeling and closing one box per 2,000 merged cards or fraction thereof.

SUMMARY PUNCH HOOKUPS

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed.
 - B. Secure the summary card stock.
 - C. Arrange the working area.
 - D. Connect the summary punch to the tabulator.
 - E. Secure and insert two control panels.
 - F. Secure test deck, master test sheet, and master summary cards.
 - G. Secure and insert paper as required.
 - H. Test the machine.
 - 1. Set machines (switches, hammerlock, clock, etc.)
 - 2. Run test cards.
 - 3. Proofread test sheet.
 - 4. Proofread (by sight-checking) ten summary cards.
 - 5. Identify test sheet and summary cards (by operator, machine, board, date, job, etc.)
 - I. Deliver test materials and results to supervisor.
 - J. Reset clock cycle counter to zero following test.
 - K. Record personnel and machine times.
- II. Standards provide for work accomplished in the following sequence:
 - A. At the beginning of a work unit:
 - 1. Gang-punch master card prepared.
 - 2. Box of card stock moved from carton to the top of cookie pusher.
 - 3. First handful (400 cards) jogged and loaded into punch hopper with master card.
 - 4. Punch started and two cards run into stacker.
 - 5. Cards removed from punch stacker.
 - 6. Gang-punching checked for accuracy.
 - 7. Punched cards destroyed.
 - 8. Empty box for summary cards moved to the top of cookie pusher.
 - 9. Box of detail cards moved from the shelf to the top of cookie pusher.
 - 10. Wedge and blocks removed.
 - 11. First handful jogged, sight-checked and loaded into tabulator hopper.
 - 12. Paper advanced to first print line.
 - 13. Tabulator started.
 - 14. Second handful loaded into tabulator hopper.
 - 15. Second handful loaded to punch hopper.

- B. At the third control break.
 - 1. Cards removed from punch stacker.
 - 2. First summary card checked with tabulation sheet for accuracy of group indication and summary data.
 - 3. Tabulation sheet checked for accuracy of control break and control number sequence.
 - 4. First summaries placed in box.
- C. At the end of each 400 summary cycles:
 - 1. Handful loaded to punch hopper.
 - 2. Cards removed from punch stacker.
 - 3. Cards jogged and sight checked.
 - 4. Cards placed in box, except last card.
 - 5. Last card checked for:
 - a. Accuracy of gang punching
 - b. Accuracy of group indication.
 - c. Accuracy of summary data.
 - 6. Last card placed in box.
- D. At the completion of 400 stacked cards in the tabulator:
 - 1. Handful loaded to tabulator hopper.
 - 2. Cards removed from stacker.
 - 3. Cards placed in box.
 - 4. Last visible sheets scanned for gross errors, sequence of control numbers, and accuracy of control breaks.
 - 5. Stacking of paper folds checked and corrected if required.
- E. At the end of each work unit:
 - 1. Cards run out into tabulator stacker.
 - 2. Control totals checked.
 - 3. Last visible sheets scanned for gross errors, sequence of control numbers, and accuracy of control breaks.
 - 4. Paper advanced for next work unit.
 - 5. Cards removed from tabulator stacker.
 - 6. Cards placed in box.
 - 7. Blocks and wedge inserted.
 - 8. Box moved from the top to the shelf of cookie pusher.
 - 9. Cards run out into punch stacker.
 - 10. Cards removed from punch stacker.
 - 11. Cards jogged and sight checked.
 - 12. Cards placed in box, except last card.
 - 13. Last card checked for:
 - a. Accuracy of gang-punching.
 - b. Accuracy of group indication.
 - c. Accuracy of summary data.

Page 3 Summary Punch Hookups

- 14. Last card placed in box.
- 15. Blocks and wedge inserted.
- 16. Box moved from the top to the shelf of cookie pusher.
- F. At the end of the job:
 - 1. Cards run out into tabulator stacker.
 - 2. Control totals checked.
 - 3. Last visible sheets scanned for gross errors, sequence of control numbers, and accuracy of control breaks.
 - 4. Paper advanced for tearing.
 - 5. Cards removed from tabulator stacker.

 - 10. Cards removed from punch stacker.
 - 11. Cards jogged and sight-checked.
 - 12. Cards placed in box, except last card.
 - 13. Last card checked for:
 - a. Accuracy of gang-punching.
 - b. Accuracy of group indication.
 - c. Accuracy of summary data.
 - 14. Last card placed in box.
 - 15. Blocks and wedge inserted.
 - 16. Box moved from the top to the shelf of cookie pusher.
 - 17. Paper torn and stacked.
 - 18. Tabulation sheets from last work unit identified.

III. Other provisions:

- A. The standards provide for the complete disposition of the cards for each work unit before the following work unit is started.
- B. When work units consist of more than 2,000 detail cards, the standards provide for the insertion and removal of blocks and wedges for one box per 2,000 cards or fraction thereof.
- C. When the number of summaries exceeds 2,000 cards per work unit, the standards provide for moving and opening one cardboard box; and for inserting blocks and wedges, labeling and moving one box for each 2,000 summary cards or fraction thereof.
- D. The standards provide for tearing paper and identifying the tabulation sheets. One tearing and identification per work unit is provided.

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure work to be processed, cards to be punched, boxes for new file, cookie pushers as required.
 - B. Arrange the working area.
 - C. Secure and insert a control panel.
 - D. Test the machine for:
 - 1. Punching all the holes required.
 - 2. Punching only the holes required.
 - 3. Proper functioning of all the comparing unit positions being used.
 - E. Reset Veeder counters to zero.
 - F. Record personnel and machine times.
- II. The standard provides for work accomplished in the following sequence:
 - A. At the beginning of each work unit:
 - 1. Empty box moved to the top of cookie pusher for new file.
 - 2. Box of cards (to feed the punch hopper) moved to the top of cookie pusher.
 - 3. Box opened.
 - 4. First handful (400 cards) jogged and loaded into punch hopper.
 - 5. Box of cards (to feed the read hopper) moved from the shelf to the top of cookie pusher.
 - 6. Wedge and blocks removed.
 - 7. First handful loaded into read hopper.
 - 8. Machine started.
 - 9. For the first work unit of a job:
 - a. Machine stopped with one or two cards in each stacker.
 - b. Cards removed from stackers and a pair compared to verify that the machine is:
 - (I) Punching all the holes required.
 - (II) Punching only the holes required.
 - c. Machine started.
 - d. First pairs placed in output boxes.
 - 10. Second handful loaded into punch hopper.
 - 11. Second handful loaded into read hopper.

Page 2 514 Reproducer - Reproducing

- B. At the end of each 400 cycles:
 - 1. Machine stopped.
 - 2. Cards removed from both stackers.
 - 3. Machine started.
 - 4. Last pair of cards compared to verify that the machine is:
 - a. Punching all the holes required.b. Funching only the holes required.
 - 5. Cards from punch stacker jogged and placed in box.
 - 6. Cards from read stacker jogged and placed in box.
 - 7. Handful loaded into punch hopper.
 - 8. Handful loaded into read hopper.

C. At the end of each work unit:

- 1. Last cards run out into stackers.
- 2. Last handful removed from stackers.
- 3. Last pair of cards compared to verify that the machine is:
 - a. Punching all the holes required.
 - b. Punching only the holes required.
- 4. Cards from punch stacker jogged and placed in box.
- 5. Cards from read stacker jogged and placed in box.
- 6. Blocks and wedges inserted in two boxes.
- 7. Two boxes moved from the top to the shelf of cookie pusher.
- 8. Veeder counters checked for agreement and one reading posted to control sheet.
- 9. Two veeder counters reset to zero.

III. Other provisions:

- A. The standard provides for the complete disposition of each work unit before the following work unit is started.
- B. When the average size of work units within a job (defined by cards for read feed) exceeds 2,000 cards, the standard provides for handling boxes removing blocks and wedges, and inserting blocks and wedges on the basis of two boxes per 2,000 cards or fraction thereof. The standard provides for labeling new boxes on the basis of one box per 2,000 cards or fraction thereof.

514 REPRODUCER - ORDINARY GANG PUNCHING

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

(Master cards not previously inserted and punching not under X-punch control)

- I. An allowance is provided for setup which includes:
 - A. Secure the work to be processed and cookie pushers as required.
 - B. Arrange the working area.
 - C. Secure and insert the control panel.
 - D. Prepare master cards.
 - E. Reset Veeder counters.
 - F. Record personnel and machine times.
- II. The standard provides for work accomplished in the following sequence:
 - A. At the beginning of each work unit:
 - 1. Box moved from the shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. Master card and first handful (400 cards) loaded into punch hopper.
 - 4. Machine started.
 - 5. First two or three cards removed from punch stacker and gang-punching verified as follows:
 - a. The correct master card is in use.
 - b. The detail card(s) has all the required holes.
 - c. The detail card(s) has only the required holes.
 - 6. Master card filed and detail card(s) placed in box.
 - 7. Second handful loaded into punch hopper.
 - B. At the end of each 400 cycles:
 - 1. Cards removed from punch stacker.
 - 2. Cards jogged and sight-checked for presence of all the required holes.
 - 3. Last card of handful examined to verify that it has only the required holes.
 - 4. Handful of punched cards placed in box.
 - 5. Next handful loaded into punch hopper.

- C. At the end of each work unit:
 - 1. Cards run out into punch stacker.
 - 2. Cards removed from punch stacker.
 - 3. Cards jogged and sight-checked for presence of all the required holes.
 - 4. Last card examined to verify that it has only the required holes.
 - 5. Last handful placed in box.
 - 6. Blocks and wedge inserted.
 - 7. Box moved from the top to the shelf of cookie pusher.
 - 8. Veeder counter total posted to control sheet.
 - 9. Veeder counter reset to zeros.
- III. Other provisions:
 - A. The standard provides for the complete disposition of each work unit before the following work unit is started.
 - B. When the average size of work units within a job exceeds 2,000 cards, the standard provides for handling boxes, removing blocks and wedge, and inserting blocks and wedge on the basis of one box per 2,000 cards or fraction thereof.

514 REPRODUCER - INTERSPERSED GANG PUNCHING

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

(Master cards inserted in a prior operation and punching under X-punch control)

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed and cookie pushers as required.
 - B. Arrange the working area.
 - C. Secure and insert the control panel.
 - D. Set X-brushes.

:

- E. Test the machine for:
 - 1. Punching all the holes required.
 - 2. Punching only the holes required.
 - 3. Proper functioning of all the comparing unit positions being used.
 - 4. Proper functioning of all X-brushes being used.
- F. Reset Veeder counters to zero.
- G. Record personnel and machine times.
- II. The standard provides for work accomplished in the following sequence:
 - A. At the beginning of each job (not work unit):
 - 1. Box moved from the shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) loaded into punch hopper.
 - 4. Machine started.
 - 5. First two or three cards removed from punch stacker and check made to see that the machine is:
 - a. Punching all the holes required.
 - b. Funching only the holes required.
 - 6. Cards from punch stacker weighted as a backlog for the read hopper.
 - 7. Second handful loaded into punch hopper.
 - B. At the end of the first 400 cycles:
 - 1. Cards removed from punch stacker.
 - 2. Cards jogged and scanned by fanning to catch blank and/or double-punched columns in gang-punched fields.
 - 3. Cards added to weighted backlog for read hopper.
 - 4. Handful loaded into punch hopper.

Page 2 514 Reproducer - Interspersed Gang Funching

- C. At the end of second 400 cycles:
 - 1. Machine stopped.
 - 2. Backlog loaded into read hopper.
 - 3. Cards removed from punch stacker.
 - 4. Machine started.
 - 5. Cards jogged and scanned by fanning to catch blank and/or double punched columns in gang-punched fields.
 - 6. Cards loaded into read hopper.
 - 7. Handful loaded into punch hopper.
- D. At the end of third and subsequent 400 cycles:
 - 1. Cards removed from both stackers.
 - 2. Cards from read stacker jogged and placed in box.
 - 3. Cards from punch stacker jogged and scanned by fanning to catch blank and/or double punched coluans in gang-punched fields
 - 4. Cards loaded into read hopper.
 - 5. Handful loaded into punch hopper.
- E. As the last of each work unit is loaded into the punch hopper, two breaker cards of distinctive color and corner cut are inserted.
- F. When the last card feeds from punch hopper:
 - 1. Cards run out into punch stacker (three cycles).
 - 2. Machine stopped.
 - 3. Cards removed from both stackers.
 - 4. Machine started.
 - 5. Cards from read stacker jogged and placed in box.
 - 6. Cards from punch stacker jogged and scanned by fanning to catch blank and/or double-punched columns in gang-punched fields.
 - 7. Cards loaded into read hopper.
- G. At the end of the next to last 400 cycles:
 - 1. Cards removed from read stacker.
 - 2. Cards jogged and placed in box.
- H. When the last card of the job feeds from read hopper:
 - 1. Cards run out into read stacker.
 - 2. Cards removed from read stacker.
 - 3. Cards jogged and placed in box.
 - 4. Blocks and wedge inserted.
 - 5. Box moved from the top to the shelf of cookie pusher.
 - 6. Veeder counter totals checked for agreement.
 - 7. One Veeder Counter total posted to control sheet. (Job total.)

Page 3 514 Reproducer - Interspersed Gang Punching

III. Other provisions:

- A. Work units within a job are to be run consecutively with breaker cards as separators.
- B. When the average size of work units exceeds 2,000 cards, the standard provides for handling boxes, removing blocks and wedges, and inserting blocks and wedges on the basis of one box per 2,000 cards or fraction thereof.

CENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed.
 - B. Arrange the work area.
 - C. Secure and insert the control panel.
 - D. Secure the test deck.
 - E. Test the machine with three cards and check for proper line and accuracy of interpretation.
 - F. Identify and return test deck to supervisor.
 - G. Reset Veeder counter to zero.
 - H. Record personnel and machine times.
- II. The standards provide for work accomplished in the following sequence:
 - A. At the beginning of a job:
 - 1. Box moved from shelf to top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) taken from front of box, jogged, and loaded into hopper.
 - 4. Machine started.
 - 5. First one or two cards removed from stacker and the accuracy of the interpretation proven in one card.
 - 6. First card(s) placed in box.
 - 7. Second handful loaded into hopper.
 - B. At the end of each 400 card cycles:
 - 1. Handful loaded to hopper.
 - 2. Cards removed from stacker.
 - 3. Cards jogged and inspected for gross interpretation failures by fanning.
 - 4. Handful to box, except last card.
 - 5. Last card examined in detail for accurate interpretation.
 - 6. Last card placed in box.

Page 2 557 Interpreter

- C. At the end of each job:
 - 1. Cards removed from stacker.
 - Cards jogged and inspected for gross interpretation failures by fanning.
 - 3. Cards to box, except last card.
 - 4. Last card examined in detail for accurate interpretation.
 - 5. Last card placed in box.
 - 6. Blocks and wedge inserted.
 - 7. Box from top to shelf of cookie pusher.
- III. Other provisions:
 - A. The standards provide for the continuous operation of the interpreter from box to box and work unit to work unit through the use of separator cards of contrasting color and/or corner cut inserted by the operator as the last handful from each box is loaded into the hopper.
 - B. When the average size of work units exceed 2,000 cards, the standards provide for handling boxes, removing blocks and wedges, and inserting blocks and wedges on the basis of one box per 2,000 cards or fraction thereof.

GENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Secure the work to be processed.
 - B. Arrange the working area.
 - C. Secure and insert the control panels.
 - D. Secure a test deck and a master test deck.
 - E. Test the machine with 20 cards.
 - F. Compare decks card for card.
 - G. Identify and return test decks to supervisor.
 - H. Reset Veeder counter to zero.
 - I. Record personnel and machine times.
- II. The standards provide for work accomplished in the following sequence:
 - A. At the beginning of a work unit:
 - 1. Box moved from the shelf to the top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) jogged and loaded into hopper.
 - 4. Machine started.
 - 5. For the first work unit only:
 - a. First one or two cards removed from stacker and the accuracy of the calculation proven in the first card.
 b. First card(s) placed in box.
 - 6. Second handful loaded into hopper.
 - B. At the end of each 400 card cycles:
 - 1. Handful loaded into hopper.
 - 2. Cards removed from stacker.
 - 3. Cards jogged and result fields examined by fanning to verify the results are being punched.
 - 4. Handful to box, except last card.
 - 5. Last card examined for accuracy of computation.
 - 6. Last card placed in box.
 - C. At the end of each work unit:
 - 1. Cards run out into stacker.
 - 2. Cards removed from stacker.
 - 3. Cards jogged and result fields examined by fanning to verify that results are being punched.
 - 4. Handful to box, except last card.

CENERAL OPERATING PROCEDURE COVERED BY STANDARDS

- I. An allowance is provided for setup and test which includes:
 - A. Turn on power switch.
 - B. Arrange the work area.
 - C. Secure work to be processed and the required equipment.
 - D. Install wire plug board.
 - E. Run test deck of cards.
 - F. Reset Veeder counter.
 - G. Record personnel and machine time.
- II. Standards provide for work accomplished in the following sequence:
 - A. At the beginning of a work unit:
 - 1. Box moved from shelf to top of cookie pusher.
 - 2. Wedge and blocks removed.
 - 3. First handful (400 cards) jogged and loaded into hopper.
 - 4. Change plugboard wire as necessary.
 - 5. Machine started.
 - 6. Second handful of cards jogged and loaded into hopper.
 - B. For each 400 card cycles:
 - 1. One handful of cards jogged and loaded into hopper.
 - 2. Cards removed as required from stacker containing the greatest number of cards.
 - 3. Cards jogged, sight-checked, and placed in sorting rack or boxes as required.
 - C. At the end of each work unit:
 - 1. Cards removed from all stackers, jogged, sight-checked and placed in sorting rack or boxes according to size of work unit.
 - 2. Cards transferred from sorting rack to boxes.
 - 3. Blocks and wedges inserted.
 - 4. Box labels modified and numbered.
 - 5. Boxes moved from the top to the shelf of cookie pusher.
 - 6. Veeder counter total posted to control sheet.
 - 7. Reset counter.

i

DEVELOPMENT OF WORK UNIT STANDARDS

Descriptions of the detailed standards have been furnished at the beginning of this section, but it is felt that the work unit standards need further clarification to enable the reader to understand their composition and purpose.

The work unit standards provide for the necessary external physical activities of an operator during a machine job. These external physical activities together with the cycling of the machine compose the total time for processing cards in a machine job. The card cycle standards as mentioned earlier compensate the operator for the machine cycling time.

The work unit standards selected for illustration pertain to the operation "Ordinary Gang Punching" on the 514 Reproducing Punch. This operation was selected because it is not complex, and there are only four work unit standard writeups involved. In comparison, the O83 Sorter standards are composed of 11 work unit sizes with each size having 35 time values representing the number of columns sorted (1 to 35).

The writeups for Ordinary Gang Punching consist of work unit sizes 1 to 400 cards, 401 to 800, 801 to 1200, and 1201 cards or more. There is no need to go any higher because the external elements remain constant for work unit sizes over 1200 cards. The writeups are shown on the following pages. Both external and internal elements are listed in the writeups so that a complete analysis of operator activity is present.

The first writeup is for work units averaging between 1 to 400 cards. All card handling elements are external because of the small volume of cards (one handful) in each work unit. Before any cards are passed through the machine the card counter is reset to zero, wedges are removed from the file box, and cards for the work unit are loaded into the machine hopper. Then the machine is started and cycling proceeds until all cards have cleared the hopper. The operator presses the start button to run out the cards remaining in the machine. The cards are removed from the stacker to the top of the machine, joggled into alignment, picked up and sight checked for correct punching, and replaced in the box. Wedges are inserted in the box when it is full. Card count of the work unit is posted to a control or job sheet. These are the external elements performed by the operator. Since the work units are so small, about five should fit into a box. Therefore, the frequency used for the elements of removing and replacing wedges is one occurrence for every five work units (1/5). Labeling the box(es) is done while the machine is cycling. It involves approximately 10 digits and letters per box so the element which is on a per-digit basis occurs 10 times for each box of five work units (10/5).

The second writeup involves work units in sizes ranging from 401 to 800 cards. Assuming that the shelves of a portable truck are used to store boxes for work units larger than 400 cards, the elements "Box to top of truck" and "Box to shelf" have been added as externals. The remaining elements are the same as in the preceding writeup. Based on an estimate of three work units to a box, the frequency for box

154

T

i

Digitized by Google

handling elements is 1/3. Labeling which is internal occurs once for every three work units or at a frequency of 10/3. When the work unit size exceeds one handful of cards, the occurrence of additional card handling and sight checking elements is internal to the machine cycling as shown in the writeup.

The third writeup is for work units of 801 to 1200 cards. The external and internal elements are similar to the previous writeups except that the frequencies are different. The box handling elements occur once for every two work units (1/2), and the labeling frequency is 10/2. Labeling is internal, and card handling and sight checking elements are internal after the first 400 cards of a work unit.

The fourth writeup is for work unit sizes of 1201 cards or The elements are the same as in the other writeups. This size more. work unit will fill at least one box so the box handling elements occur once in a work unit as do the other external elements. Labeling which is on a per-digit basis occurs internally with every work unit. Since an estimate of 10 digits and letters are marked on a box, the frequency for labeling is 10/1. The box handling elements for one box occur externally, and for any additional boxes in a work unit, internally. Card handling and sight checking elements are external for 400 cards, and internal for the balance of the cards in a work unit. Once a machine is started, cards are removed, checked, and placed in boxes; the boxes are blocked, labeled, and placed aside when filled; and the machine hopper is loaded intermittently -- all internal to the machine cycling except for the last handful of cards and the last box in a work unit.

Each writeup shows the total external normal minutes per work unit, the application of 10% personal and delay allowance, and the standard minutes for the size of work unit mentioned. A description of the elements in the work unit writeups is shown on pages 161 and 162.

Description of Work Elements

Reset Veeder Counter

Operator reaches to Veeder counter (either in front or back of machine); places thumb or forefinger on wheel of counter; presses forward, rotating wheel until counter is reset to zero.

Box to Top of Truck

Operator reaches for file box on shelf of truck; grasps front of file box with one hand; pulls it out of shelf sufficiently to grasp with other hand; lifts file box from shelf and raises it to height of truck; places box in selected location on top of truck and releases it.

Remove Wedges

(wood wedges) Operator picks up wedge hammer and inserts claw end along side of wood wedge in file box; presses hammer head away from side of box to force claw end against side of wedge and raise it; grasps edge of wedge with fingers; pulls it out together with any additional wedges or blocks in box and places them aside; places aside wedge hammer.

(cardboard or cardboard and wood wedges) Operator grasps file box firmly with one hand; grasps flap of cardboard wedge with fingers of other hand; pulls out wedge and places aside together with any additional wedges or blocks in box.

Load Hopper

Operator picks up handful of cards from file box on top of truck or from pocket of rack; fans both ends of handful of cards while turning to machine, places cards along raised edge of machine top and joggles them until cards are evenly positioned; lifts out weight in machine hopper; places cards in hopper and replaces weight.

Start Machine

Operator presses button, clicks switch, moves lever, or performs similar movement to start machine in operation.

Runout

Operator reaches to control button at front of machine; depresses button and keeps it depressed until cards held internally in the machine are cleared into card pocket(s) or stacker(s).

Pocket to Machine Top

Operator grasps card(s) in machine pocket; withdraws card(s) clear of pocket; places card(s) on top of machine.

Sight Check

Operator raises handful of cards to light; sights through predetermined location of punch hole(s) in cards.

Machine Top to Box

Operator picks up stack of cards from top of machine; joggles cards into a neat, even stack on joggle plate at top of machine; turns about and places cards in box or rack.

Insert Wedges

(wood wedges) Operator picks up unbeveled wood wedge with one hand; firmly presses cards in file box against front end of box with other hand; inserts unbeveled wedge in space at rear of file box; picks up beveled wood wedge and inserts it alongside first wedge, narrow edge down; picks up wedge hammer and pounds top of beveled wedge until it is flush with top of file box; places aside wedge hammer. When necessary several cards are removed from or added to file box to permit wedges to fit firmly.

(cardboard or cardboard and wood wedges) Operator picks up cardboard or unbeveled wood wedge with one hand; firmly presses cards in file box against front end of box with other hand; inserts unbeveled wood wedge or cardboard wedge in space at rear of file box; as necessary picks up additional cardboard wedges and inserts them in space at rear of file box, pressing them firmly in place with thumb of both hands. If necessary, removes or adds a few cards to file box to permit wedges to fit firmly.

Label Boxes

Operator picks up marking pencil and turns to file box; marks identifying numbers or letters or combination of both on face of file box (positions file box if necessary); places marking pencil aside.

Box to Shelf

Operator grasps file box on top of truck with both hands; picks it up or slides it off top of truck; lowers it to appropriate shelf of truck; places rear end of file box on shelf; slides box onto shelf and releases it.

Post Veeder Count

i

į

Operator picks up pencil; observes total card cycle count on Veeder counter attached to machine; posts count to job sheet or other recordkeeping document; places pencil aside. Part IV

Measuring Individual Productivity with Detailed Standards

.

Introductory Comments

This final section of the manual illustrates how to measure productive effort of individual tabulating equipment operators with the detailed engineered standards described previously. A basic requirement for computing performances is a daily reporting form which is prepared by each operator showing the jobs on which she worked. The form should provide space for posting details of each machine job such as card counts, number of work units, type of machine, operation, etc. When a non-machine activity occurs, a written entry is made describing it.

In addition to providing data for computing operator performance, a reporting form also furnishes written accountability of total work time by activity, by operator. This information when summarized is extremely useful to operating officials for budgeting, staffing, machine utilization, work distribution, etc.

An example of a reporting form which meets the requirements and is called "Daily Time and Production Record" is described in the following pages.

The Reporting Form

The "Daily Time and Production Record" form contains twenty-six columns. Eighteen are used by the operator to report details of machine jobs, one is used by the supervisor to initial entries, and seven are used by the standards computation clerk in calculating performances. The heading of the form contains spaces for operator name and number, section, date, and lunch period. These are self-explanatory. Since the column titles require some clarification, a list of them is furnished below in numerical order together with an explanation of each.

Column <u>Number</u>	Column <u>Title</u>	Explanation of Entry
1	Start	Operator records the actual beginning and ending times of each machine job or other activity,
2	End	using time clocks conveniently located in the work area. The time is stamped on the form in hours and tenths of an hour; each tenth is equivalent to six minutes. The entries can also be handwritten.
3	Elapsed Minutes	This column shows the minutes spent on each activity recorded by the operator. The entry is made usually by the person who computes the performance of the operators. It is determined by subtracting starting time from ending time and converting to minutes.
4	Machine Type	Operator records the type number of the machine used for each job (083, 088, 407, etc.).
5	Op er- ation	Operator writes the type of operation performed on the machine (sort, tab, seq., repr., etc.).
6	Job, Chart and Step. No.	Operator writes identifying code number(s) and/or letter(s) for each machine job.

Digitized by Google

Column <u>Number</u>		Explanation of Entry
7	No. of Tests	Operator records number of necessary machine tests actually performed for the job.
	Work from:	
8 9	Box Rack	Operator places checkmark in appropriate column to show whether cards were assembled in boxes or racks.
10	No. Columns Sorted	For each sorter job, operator posts the total number of columns in which the cards were sorted.
	Problem Cards:	
11	No. of occur.	Operator posts the number of times problem cards occurred during any machine job.
	No. of	
	cards	
12	Rej.	Operator writes in the appropriate column the
13 14	Jam Seq.	total number of problem cards which had to be corrected and replaced during the occurrences reported in column 11. A "reject" card is not usually considered as a problem card for standards purposes. Column 12 merely provides a location for recording the count of cards which were rejected during a machine job if a count is required for control purposes.
15	No. of Work Units	Operator records total number of work units in each machine job.
16	Card Cycles or Clock Time	Operator transcribes the total number of card cycles counted for each job on the Veeder counter, or total minutes of cycling time recorded for each job on the machine clock.
17	Total cards in file	Operator posts the actual number of cards in the job as shown by Veeder counters, printouts, job tickets, etc.

ī

I

Column <u>Number</u>	Column 	Explanation of Entry
18	Prints	This column applies to machine jobs in which certain types of printouts are made. The operator makes an entry when a record is required of the total sheets or items printed in a job.
19	Speci- fied card count	This space is available for special card counts or other type counts not usually recorded. Operator makes an entry as instructed.
20	Remarks	This column is used primarily for supervisor's initials to validate entries.
	in by t	aining columns on the form are filled he person who computes the performance operators.)
21	Average Cards per Work Unit	Clerk computes and records the average size in cards of the work units in each machine job. (column 17 divided by column 15)
22	Standard Minutes Card Cycles or Clock Time	Produced: Clerk computes and records standard minutes produced for machine running time from card cycles or clock time shown in column 16, using detailed standards.
23	Work Units	Clerk computes and records standard minutes pro- duced for the work units in each machine job (column 15), using detailed standards.
24	Set Up, Tests, Problem Cards	Clerk computes and records standard minutes produced for set up, tests, and problem cards reported for each machine job, using detailed standards.

Column <u>Number</u>	Column <u>Title</u>	Explanation of Entry
25	Total Standard Minutes Produced	Clerk summarizes entries in column 22, 23, and 24 and transcribes total to this column.
26	Total Minutes Charged	Clerk transcribes to this column the elapsed minutes posted in column 3 for each machine job.

The reporting form on the next page contains job entries for one day's work on tabulating equipment. The entries are actual jobs which were selected from different reporting forms and grouped on one form to show as many as possible of the different machine types with standards. The jobs are identified by capital letters on the left margin. Production performance for the day's work has been computed and recorded. Detailed explanations of the computations follow the reporting form.

COMPUTING OPERATOR PERFORMANCE

Listed below are the machine jobs described in the reporting form on the preceding page. Each job has an outline of the standards used and the computations performed in determining standard minutes produced.

It should be noted that the "Set Up" is not a recordable columnar entry on the reporting form. Normally each line entry of a machine job represents a new job (different card file/different machine) and entitles the operator to a "Set Up." The exception is when an operator runs several different jobs on the same machine with the same file of cards. When entries on a reporting form indicate that this has occurred, which is quite unusual, the standards computation clerk allows only one "Set Up" for the series of jobs.

Preliminary notes:

To determine average cards per work unit (col. 21), divide total cards in file (col. 17) by number of work units (col. 15).

To verify total card cycles (col. 16) in a numerical sorting job, multiply total cards (col. 17) by number of columns sorted (col. 10).

To determine elapsed minutes (col. 3) from time clock recordings to tenths of an hour in "Start" and "End" columns (1 and 2), subtract start time from end time and multiply the difference by 60. (Be sure to subtract 30 minutes or whatever time is allocated for lunch period when it occurs.)

> Example: End 10.2 Start - 08.4 1.8 <u>X 60</u> Elapsed Minutes 108

The entry in column 3 is also posted in column 26, total minutes charged, for all jobs on standard. This provides parallel columns of entries for minutes produced (col. 25) and minutes charged which can be compared at a glance from job to job to detect any patterns or extremes in performance which may have to be analyzed.

Before continuing, please locate the section with detailed engineered standards in Part III for ready reference in analyzing the computations for the jobs on standard.

Job "A"

Sorting on 083

The entries posted for this job show that there were 7425 cards (col. 17) comprising 6 work units (col. 15) which were filed in boxes (col. 8). It was a 5-column sort (col. 10) involving 37125 card cycles (col. 16).

Job "C"

Listing on 407

This line entry shows that there were 749 cards in the job (col. 17), that it had 1 work unit (col. 15), and that 1 test was performed (col. 7). The machine clock registered 5.9 minutes of running time (col. 16).

Job "D"

Listing on 407

This machine job had a total of 2395 cards (col. 17) comprising 1 work unit (col. 15). One test was performed (col. 7). A total of 2395 card cycles, the equivalent of total cards, was reported in column 16 because the machine had no clock.

Job "E"

Summary Punch Hookup on 407/514

This line entry shows that there were 4120 cards in the job (col. 17) which consisted of 8 work units (col. 15). One test was performed (col. 7). The machine clock registered 62.1 minutes of running time (col. 16). A count of 1000 summary cards punched is shown also in column 16 but this record is for control purposes only.

Job "F"

Interspersed Gang Punching on 514

This machine job contained a total of 4041 cards (col. 17) and processed an equivalent number of card cycles (col. 16). There was 1 occurrence of problem cards (col. 11) involving 1 card (col. 13). The number and size of work units is not relevant because there are no work unit standards for this type of operation. Instead, a "Per Job" standard was developed to provide for the physical elements which must be performed while the machine is idle. This time value is earned for each job of this type, and it is posted in column 23, work units standard minutes produced.

5326 Card Cycles @ .0105(col. 22) 55.9 1 Work Unit @ 3.786(col. 23) 3.8 (The size of the work unit is 5326 cards (col. 21). It appears within the range of 5201-6800 cards which determined selection of the time value.) Set Up (over 1000 cards in deck).....(col. 24) 5.0 Total Standard Minutes Produced....(col. 25) 64.7

Job "H"

Merging on 087

This machine job contained 4525 cards (col. 17), based on a count of cards which passed through the primary feed of the machine. The cards were assembled in boxes (col. 8) and consisted of 2 work units (col. 15). One test was performed (col. 7), and there were 3 occurrences of a jam (col. 11) involving 3 cards (col. 13). The machine clock registered 20.4 minutes of running time (col. 16).

20.4 minutes running time plus 5% personal 21.4 2 Work Units @ 1.885(col. 23) 3.8 (The average work unit size is 2262 cards (col. 21). The time value used is from the range of "1201 or more" cards, under the category "Working from boxes.") Set Up (over 1000 cards in deck)..... 3.0 First Test..... 5.0 Problem Cards: 3 occurrences of jam @ .70 2.1 3 problem cards @ .55 1.7 (col. 24)Total Standard Minutes Produced....(col. 25) 37.0

Job "I"

Merging on 088

The machine on which this job was run had no clock so the count of cards which passed through the primary feed of the machine was used for standards computation purposes. This count is 18174 and is posted on the reporting form under card cycles (col. 16) and total cards (col. 17). The cards were filed in boxes (col. 8) and were grouped into 3 work units (col. 15).

<pre>18174 Card Cycles @ .00189 (no clock; count of primary feed used)(col. 22) 3 Work Units @ 1.885(col. 23) (The average work unit size is 6058 cards (col. 21). The time value used is</pre>	
from the range of "1201 or more" cards, under the category "Working from boxes.") Set Up (over 1000 cards in deck)(col. 24) Total Standard Minutes Produced(col. 25) Digitized by Google	<u>3.0</u> 43.0

Job "J"

Interpret on 557

This machine job contained a total of 3487 cards (col. 17) and processed an equivalent number of card cycles (col. 16). There was 1 occurrence of problem cards (col. 11) involving 2 cards (col. 13). The number and size of work units is not relevant because there are no work unit standards for this type of operation. Instead, a "Fer Job" standard was developed to provide for the physical elements which must be performed while the machine is idle. This time value is earned for each job of this type, and it is posted in column 23, work units standard minutes produced.

557 Interpreter Standards:	Standard Minutes Produced
227 moorpreder blandards.	
3487 Card Cycles @ .0105(col. 22) Per Job (1.695)(col. 23) Set Up (over 1000 cards in deck)	36.6 1.7
l occurrence of jam @ .70	
2 problem cards @ .55 <u>1.1</u>	
(col. 24)	8.3
Total Standard Minutes Produced(col. 25)	

The sum of standard minutes produced is 505.3 as shown in column 25 of the reporting form, and the sum of minutes charged is 480 as shown in column 26. These two figures are used to determine the operator's performance which is 105%. The formula for computing percent performance is:

> Standard Minutes Produced X 100 = % Performance or $\frac{505.3}{480}$ X 100 = 105%
